

Using FAS Solutions with Remote Access Technologies

FAS fixed asset management solutions give you the flexibility to manage fixed assets anytime, anywhere. That's because FAS works with virtually any remote access technology, enabling seamless remote connection to your fixed asset information. This allows you to update, manage and report on your fixed asset data whether you're traveling, telecommuting or working in a remote office. A large number of FAS customers currently access FAS remotely for reliable, flexible fixed asset management.

There are a variety of reasons you may be considering employing a remote access technology to manage your fixed asset data. Using FAS remotely proves particularly convenient for branch offices that need to update fixed asset information even if the application is not deployed at every site. Remote access technology also enables telecommuters to use FAS. You can even share your fixed asset data with your CPA without having to send files or disks between offices.

FAS

FAS® Works with Popular Remote Access Technologies

FAS comes built-in with the ability to connect you to your data via any new or existing remote access technology with minimal implementation effort. Many FAS customers utilize Citrix®, including their GoToMyPC™ service, to link to their fixed asset information from home or while on the road. Microsoft® Windows® Terminal Services and Remote Desktop are included free of charge in some versions of Windows, so you can start to use FAS remotely with no additional start-up costs. You can enable remote access to FAS using any of these leading technologies:

- Citrix
- Windows Terminal Services
- Windows Remote Desktop (built into Windows XP)
- VPN
- And many more!

Centralized Data Ensures Security and Accuracy

When users access FAS remotely, fixed asset information is stored in one central location, ensuring accuracy across the organization. With the FAS application deployed at a single source, all upgrades and database conversions can be performed in the same place, while users can be located anywhere. Whether sitting down the hall, working from home, or traveling across the country, remote access technologies allow FAS users access to the same information they would have if the application were installed on their own PC.

Remote access technologies ensure that the data you update in FAS is completely secure, an important consideration in today's environment. Unlike applications accessed via a Web browser, all FAS data remains on the computer or server that contains the FAS application. There is no need to install FAS, or any of your potentially sensitive financial database files, on the remote user's computer. With today's popular remote access systems, you send only keystroke data back to FAS — not entire records of sensitive financial information!

Complete Fixed Asset Control with Added Convenience

By employing remote access technologies with FAS, you'll benefit from the performance of FAS wherever you happen to be! You'll gain access to every feature in FAS and use the same familiar interface without worrying about compromising security or limiting performance. As you work with fixed asset data, your changes are made securely and in real-time in a centralized location so that both remote and on-site users benefit from total data accuracy and integrity.
